

# Automotive Software Engineering

By Jacob Neiheisel & Cooper Myers

# High Level Description

Our team is working on creating a tilt-compensated compass. We will be using a Raspberry Pi with an IMU and two LED displays. We will read input telling us the direction and degree of rotation and print that into our display. From there, we will implement the factor of tilt with a reading on our other display.

# Timeline - Burndown Chart

Remaining tasks:

- Configure Pi
- Interface Pi and IMU
- Seven Segment/LED Display wiring
- Program Skeleton
- Efficient Calibration
- Magnetometer data to be computed
- Working Program
- Output Display all motions
- Reduce Output Errors
- Testing and input validation

## Demonstration
